

ABSTRACT OF THE DISCLOSURE

A reusable container has a card holder secured to an exterior surface thereof. The card holder includes a first ply of a film material having an upper surface and a lower surface, and a second ply of a film material having an upper surface and a lower surface. The first ply and the second ply each have substantially coextensive top and bottom edges substantially parallel to each other. The plies also have substantially coextensive first and second side edges substantially parallel to each other and substantially perpendicular to the top and bottom edges. An ultraviolet radiation curable adhesive holds the plies together, with the upper surface of the first ply in contact with the lower surface of the second ply. The curable adhesive extends around at least a portion of the periphery of the first and second plies so as to define a pocket in conjunction with the first and second plies in which an informational card may be positioned.
